

AIOps Assignment 1 Report

K.Rishitha, DA24B040

Question 1

The detailed answers are included in the file `Question1_Answer.txt` in the repository.

Question 3

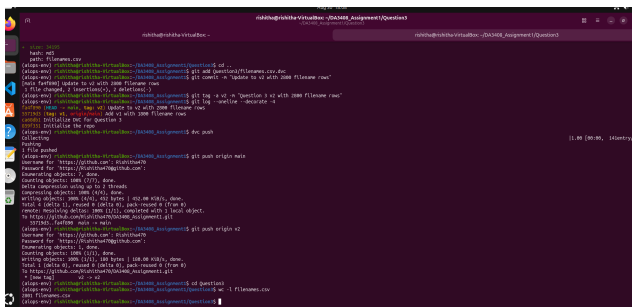

For Question 3, I created a CSV containing the filenames from the provided dataset. The first version contained 1800 filename rows, while the updated version contained 2800 filename rows.

DVC was initialized inside the Git repository, and the CSV was tracked using DVC. The first version was committed and tagged as `v1`. After adding the new data, the CSV was regenerated, tracked again with DVC, and committed as `v2`. A Backblaze B2 remote was used to store the DVC data.

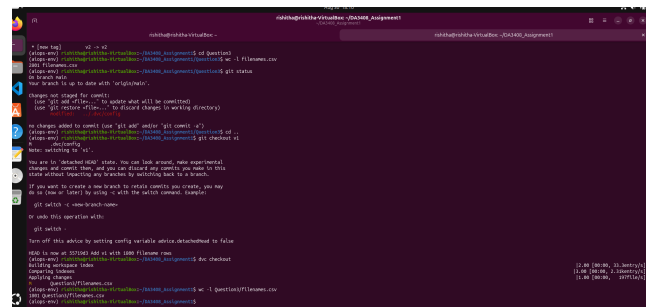

The rollback was demonstrated using:

```
git checkout v1
dvc checkout
```

After the rollback, the CSV contained exactly 1801 lines, including the header, confirming that the version was successfully restored.

```
git checkout v1
dvc checkout
```

```
git status
git log
```

Question 4

Question 4 was completed collaboratively. Partner A prepared the reproducible project by training the model, tracking the experiment with MLflow, versioning the data with DVC, and committing the required files. My role as Partner B was to reproduce the experiment.

I reproduced the experiment on Windows using the committed repository state and compared the result with the original experiment. The reference test accuracy was 0.969800, while my reproduced accuracy was 0.968800. The absolute difference was 0.0010000, which exceeded the specified tolerance of 0.0001. Therefore, the final result was recorded as REPRODUCTION DID NOT MATCH. The difference was small and was documented as a possible cross-platform floating-point difference.

The shared collaborative repository for Question 4 is linked from the main assignment repository.
